

Thermal Tracking Software *

Features:

- Mid and Far wave infrared detectors
- Dual vision systems featuring visual and infrared cameras
- Pan and Tilt
- Distance to 12 miles
- Machined all weather environmentally sealed enclosures

Installation configurations:

- Hardwire
- Wireless
- Wireless LAN
- Fibre Optic
- Remote Operations
- Battery Powered Systems

Thermal imaging greatly increases security effectiveness by detecting and tracking intruders, preventing terrorism before it happens.

Our computer automated tracking system, using Infrared, Inc.'s imageIR TRAC™ software, features thermal tracking detection. This one of a kind software utilizes a unique thermal signature process to track movement. It is available in customized installation configurations.

Infrared, Inc.'s systems are passive and non-intrusive, detecting through pitch-black darkness, in most weather conditions and over long distances. Thermal imagers work day or night and do not require ambient light to see perfectly in the dark. As a result, our systems are invisible to any intruder and allow security personnel to monitor their actions without their knowledge. Our systems let you see things that never would have seen before, protecting people and assets before they are exposed to danger.
